Class #2 Agenda

- Review Android app navigation structures
- Assignment 1 discussion
- Review of Android UI Design/Components
- Discuss Assignment #2
- Setting up Android Studio

Apps deconstructed (Android)

Navigation structure

- Please view this video over the next week:
- **Structure in Android App Design**
- <https://developers.google.com/events/io/sessions/326301704>
- PDF for reference:
 - I I8 - I_O 2013- Structure In Android App Design.pdf

A typical Android app consists of top level and detail/edit views. If the navigation hierarchy is deep and complex, category views connect top level and detail views.

Top level views

The top level of the app typically consists of the different views that your app supports. The views either show different representations of the same data or expose an altogether different functional facet of your app.

Category views

Category views allow you to drill deeper into your data.

Detail/edit view

The detail/edit view is where you consume or create data.

A typical Android app consists of top level and detail/edit views. If the navigation hierarchy is deep and complex, category views connect top level and detail views.

Assignment #1

- Design a simple (native) mobile application

Step 1: View this video online

- Structure in Android App
Design

- <https://developers.google.com/events/io/sessions/326301704>

Class List App

- **CS 150 Class List app**
- An Android app that when launched lists the students and teachers in the class
- The app allows the user to browse filtered lists of all members of the class, students & teachers
- The app allows the user to view a detailed screen of a member of the class including a photo, name, email and phone number

Class List App

- **Logistics**
- To start, we will work on the design
- Submit your work in whatever format you choose: can be PPT or Word document, or hand sketches

A. List the actors (users)

- Users should be the end user, not the creators of content

User

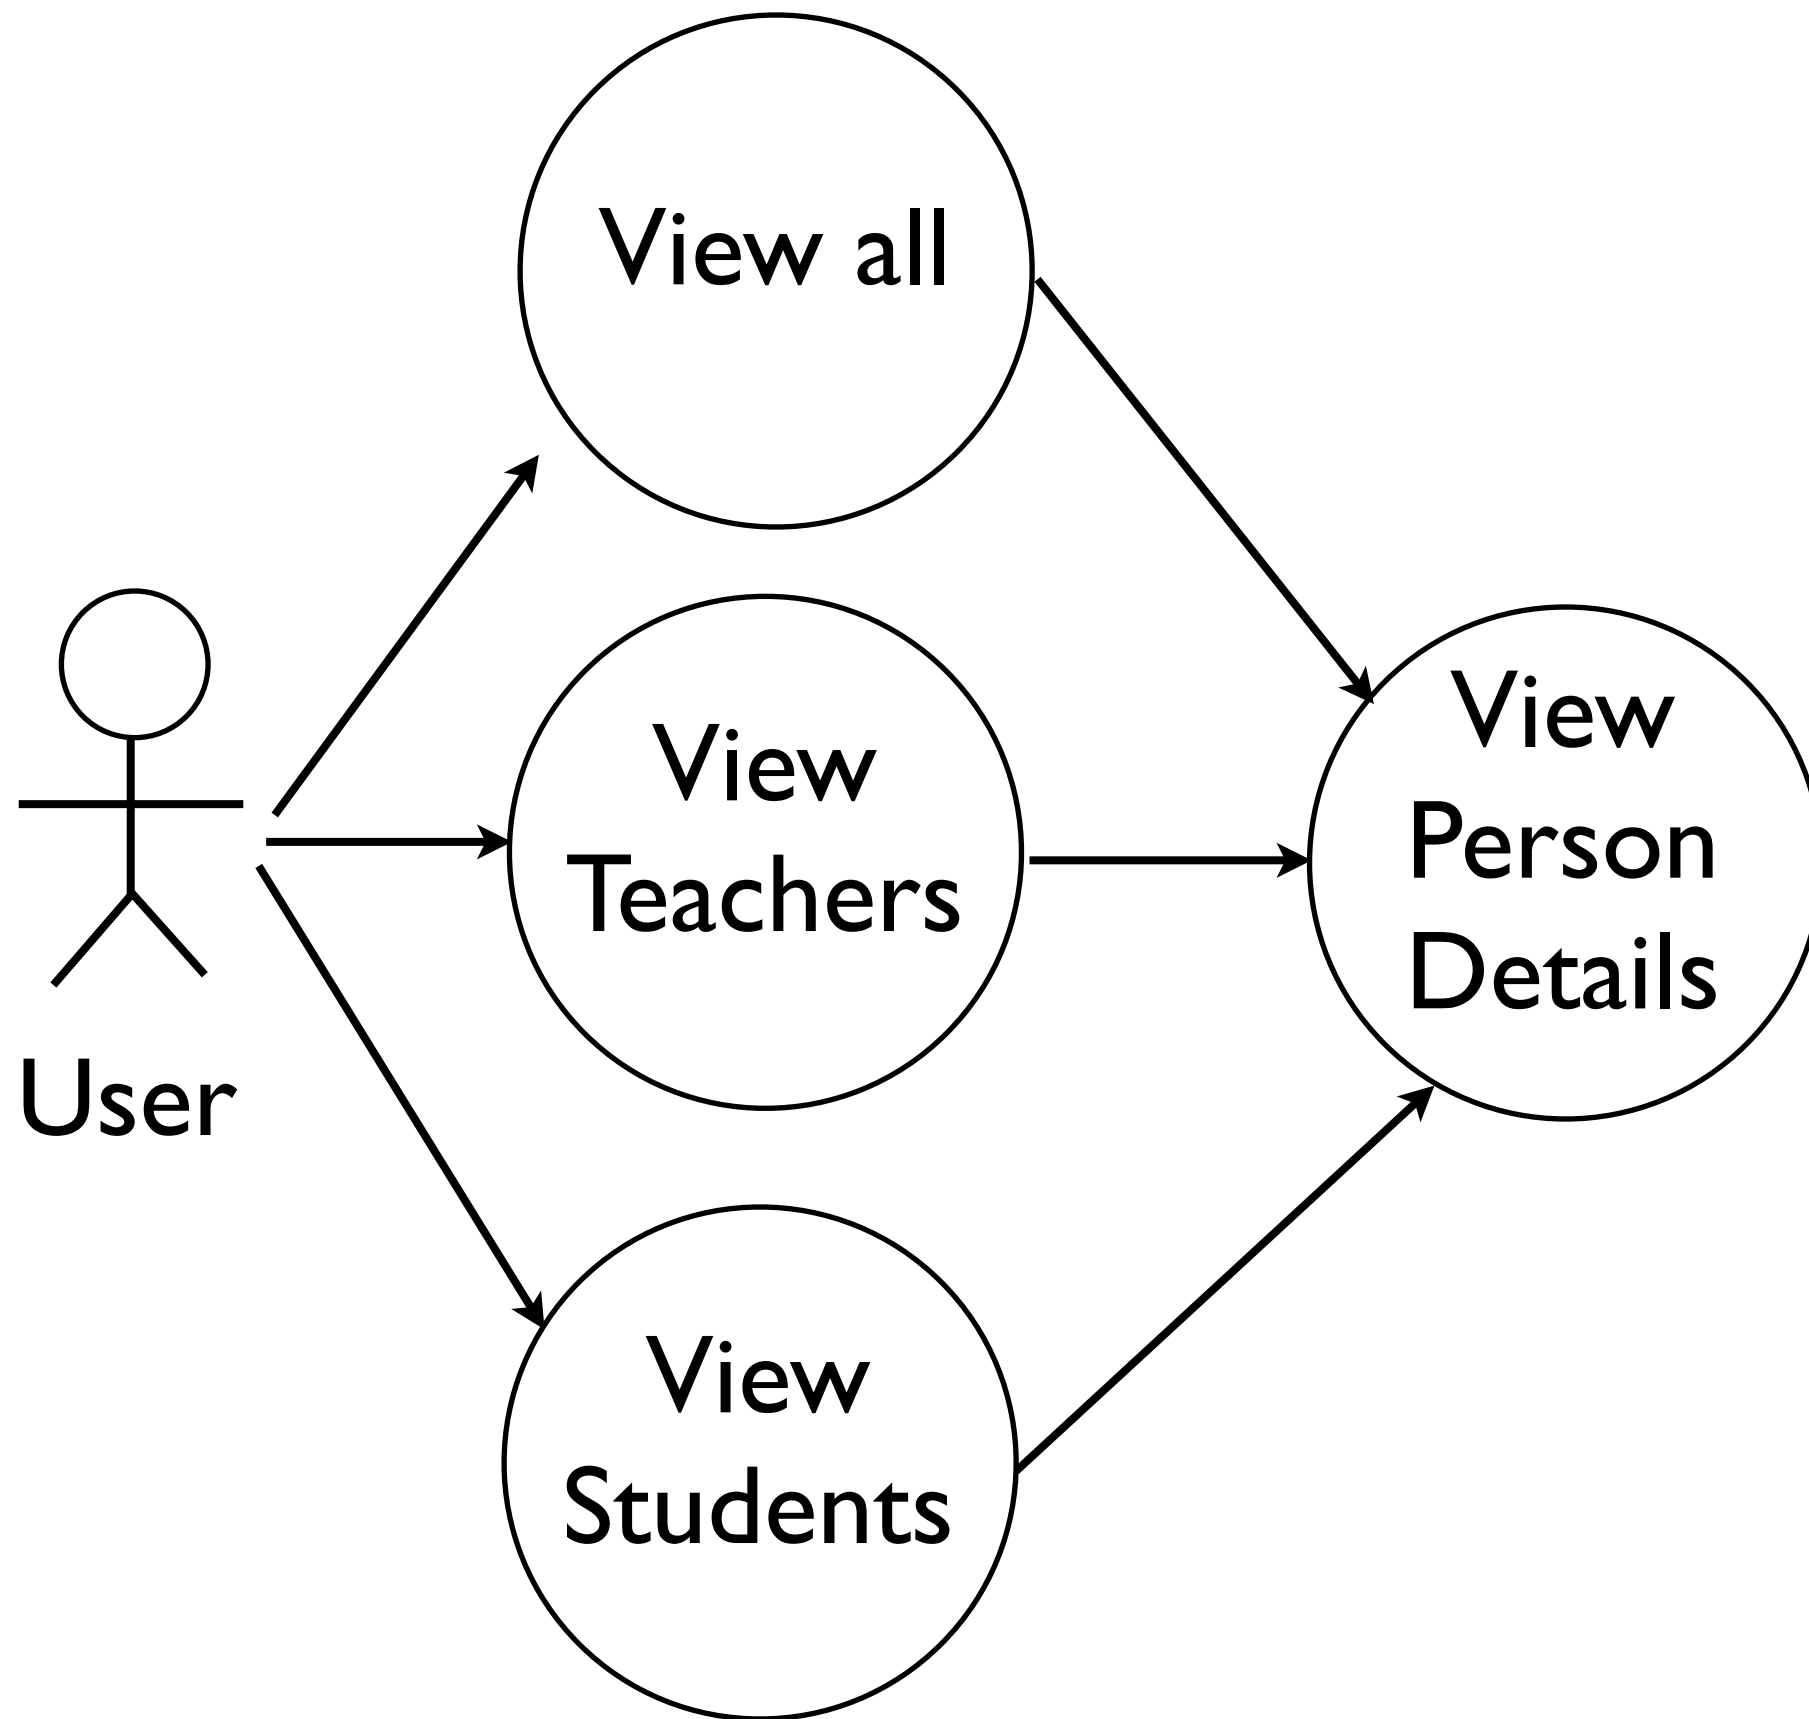

B. Write the use cases

- Limit to the top 3-5 use cases
 - View all class members in a list
 - View teachers in a list
 - View students in a list
 - Look at the details for a person

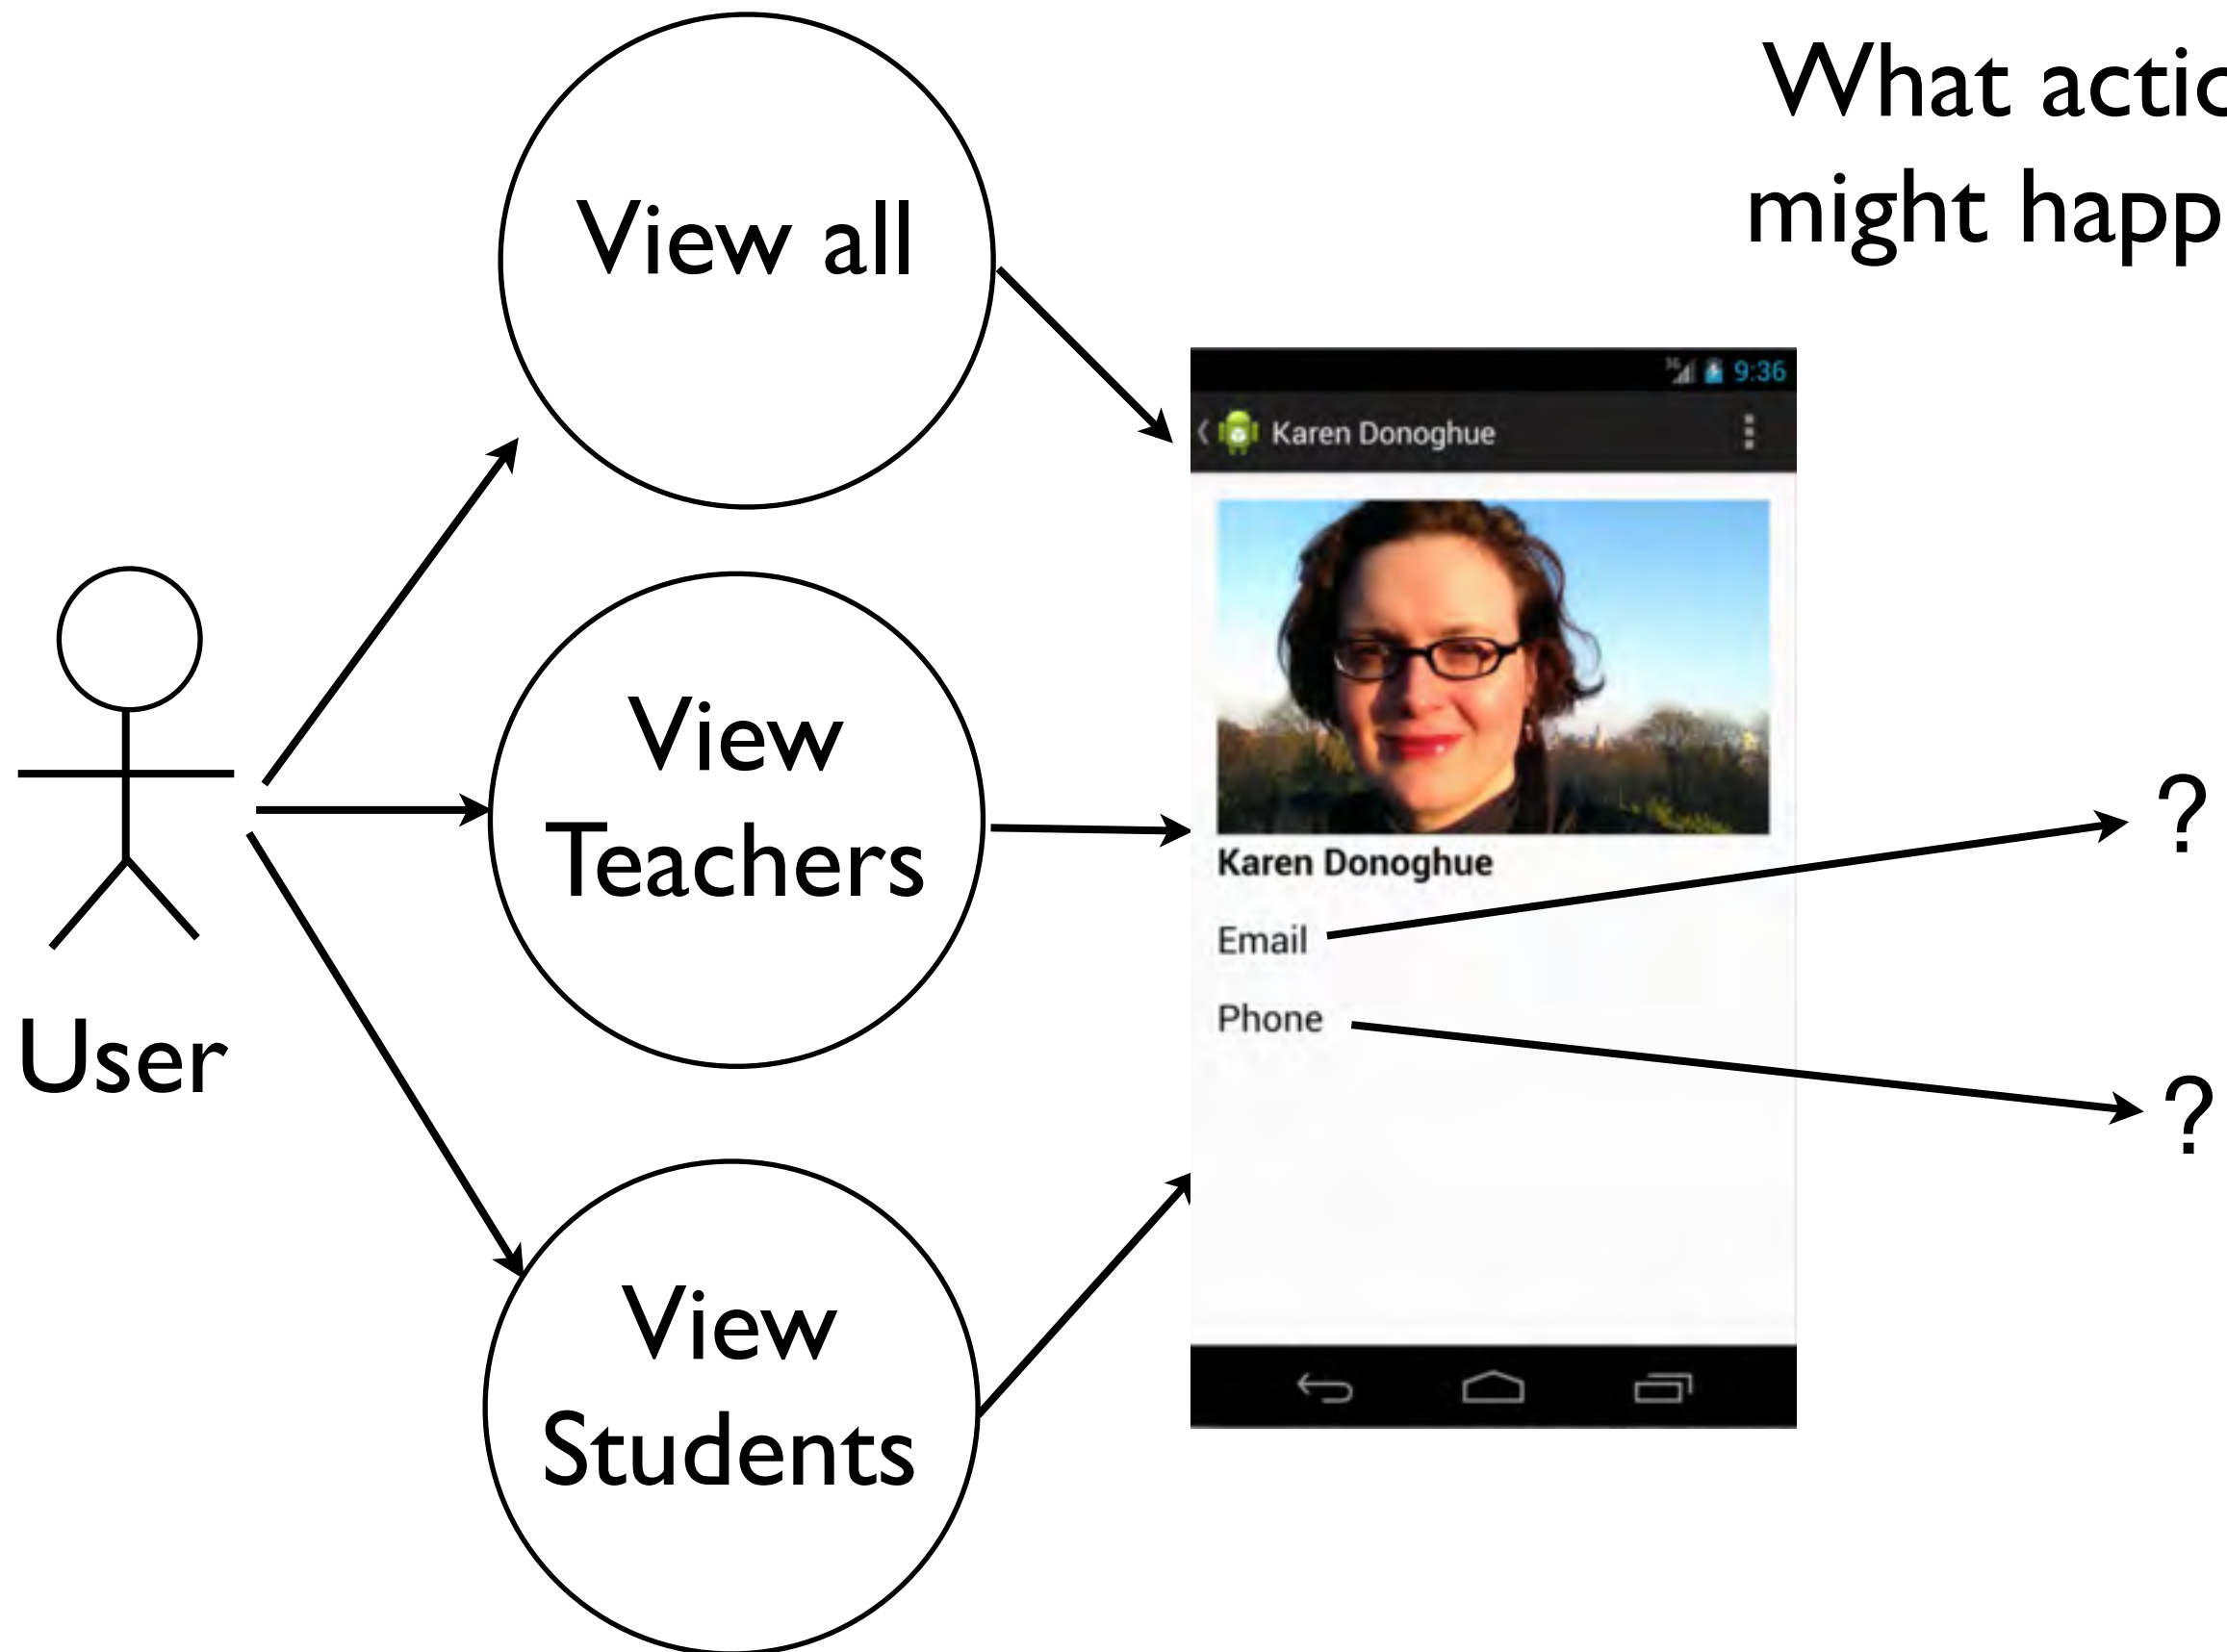

C. Create the use case diagram

- Include
 - actor(s)
 - relationships
 - use cases

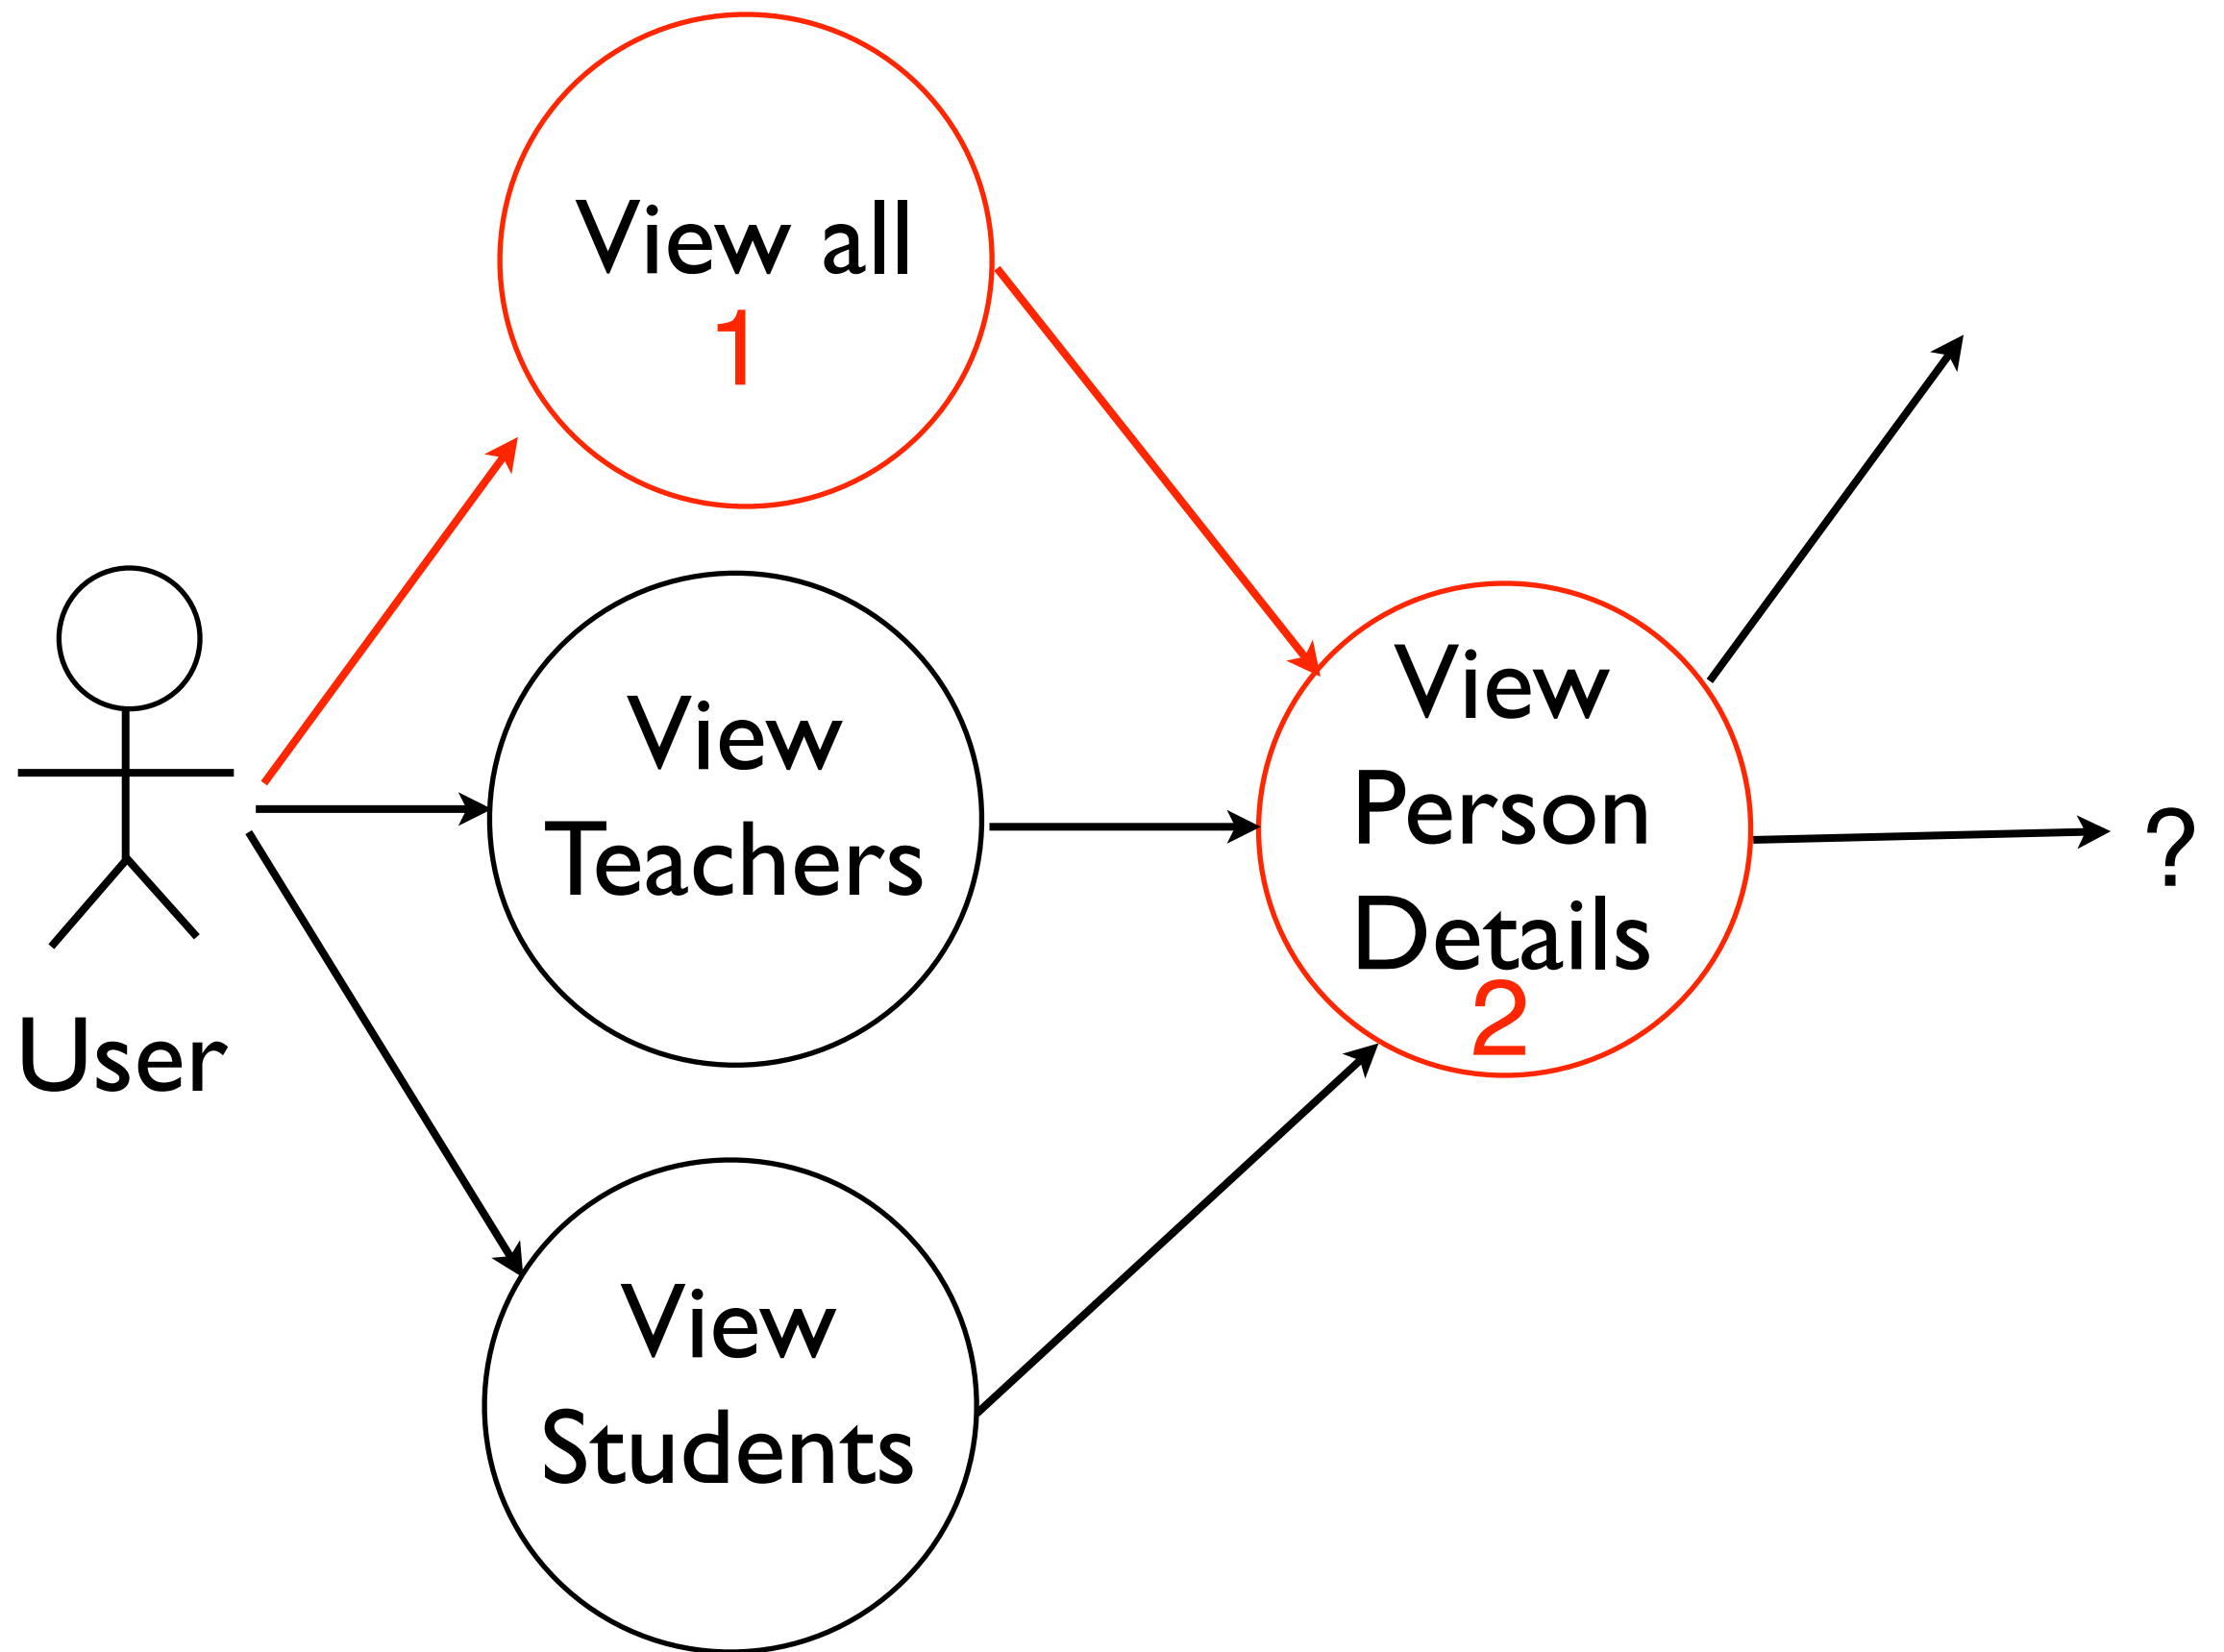

What actions
might happen?

D. List the use cases in sequence

- Define the sequence in which the top 3-5 use cases occur

Why does sequence of use cases matter?

E. Decomposition

- List what are the most frequently used pathways through your app?
 - View all → View Person details
 - View Teachers → View Person details

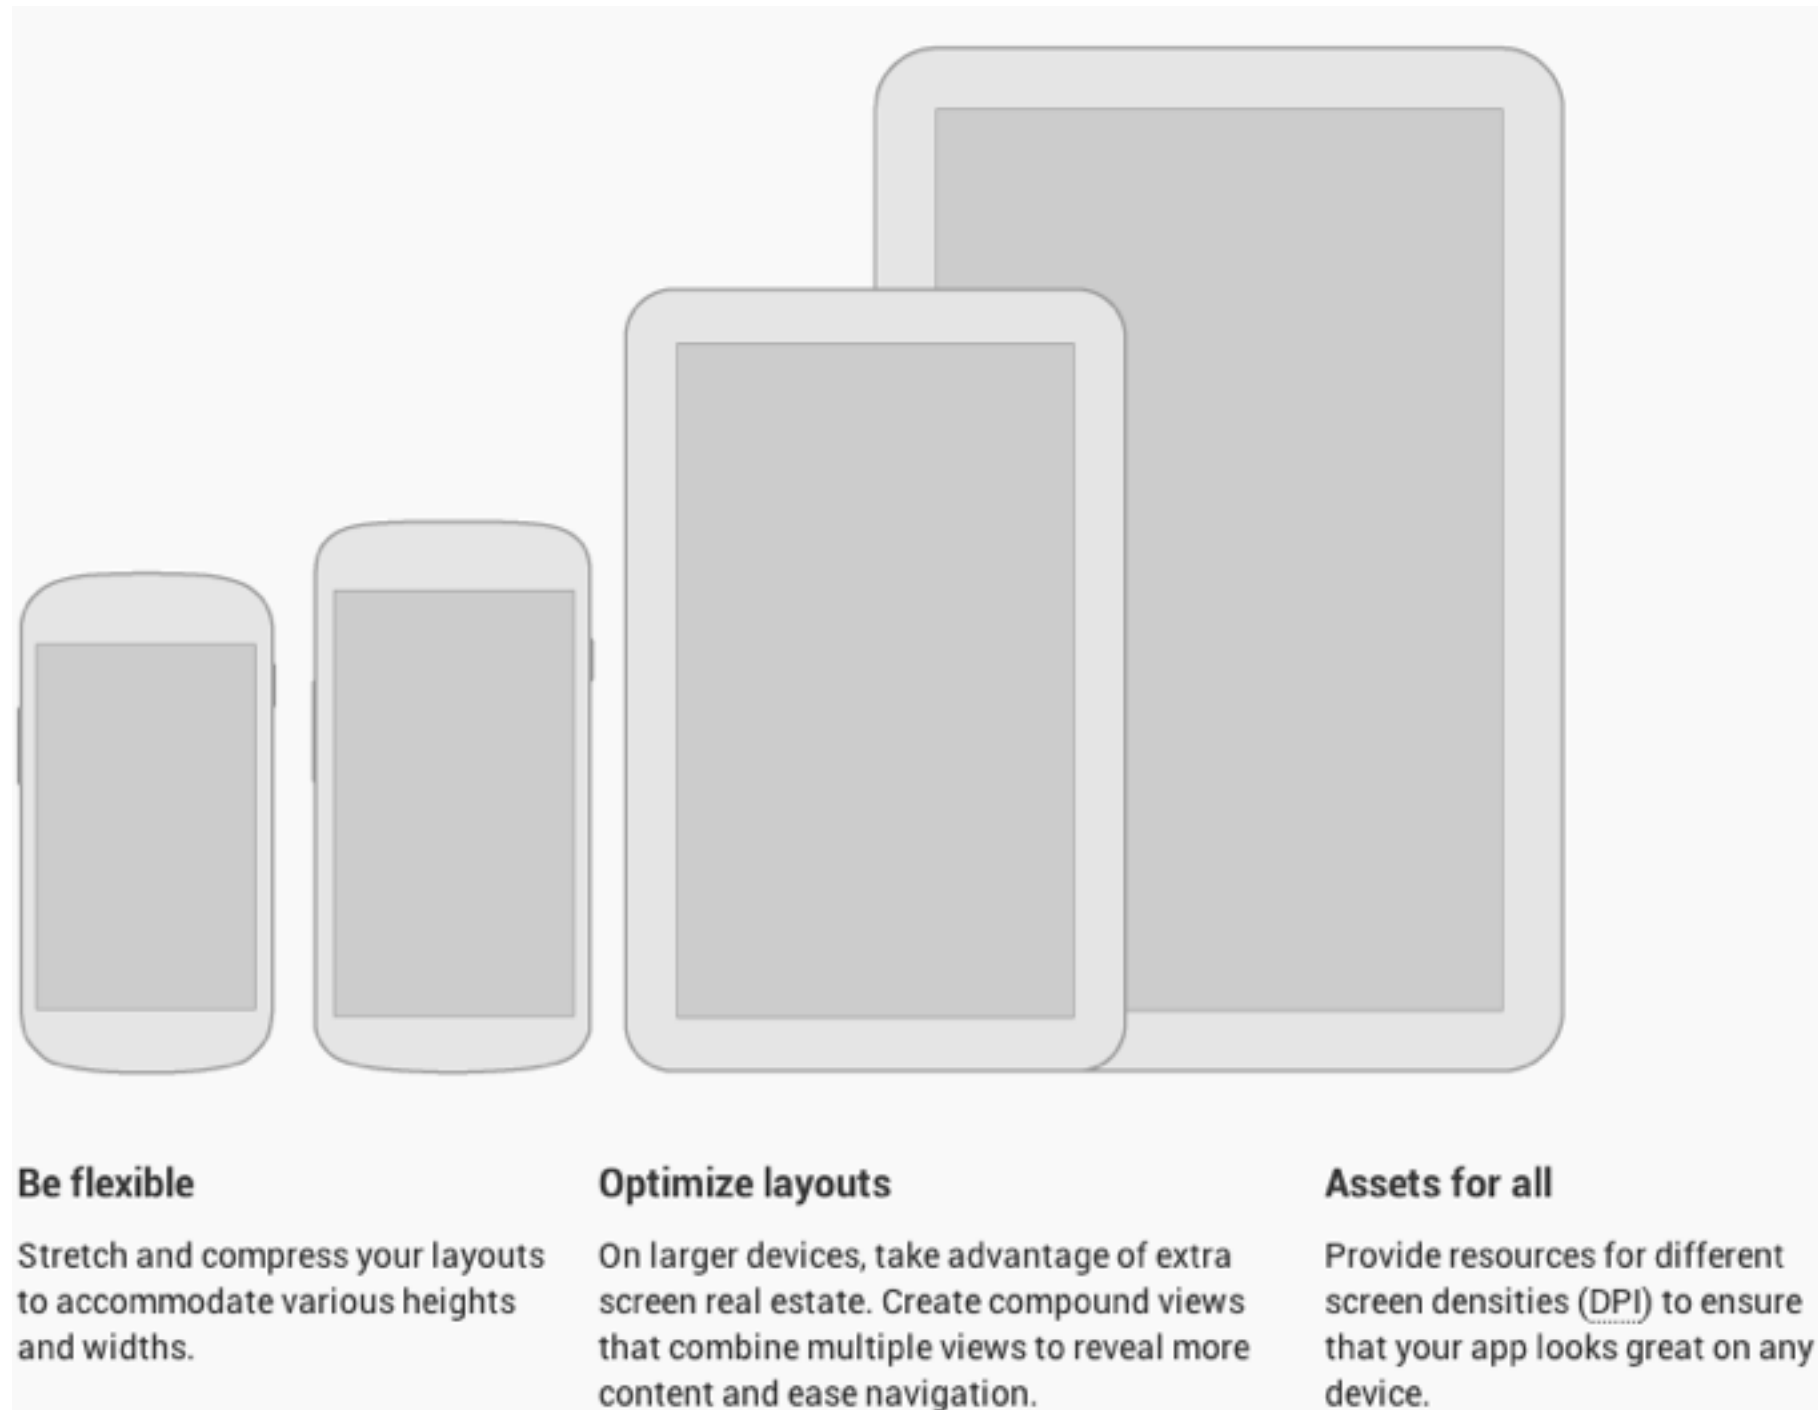

F. What happens when...?

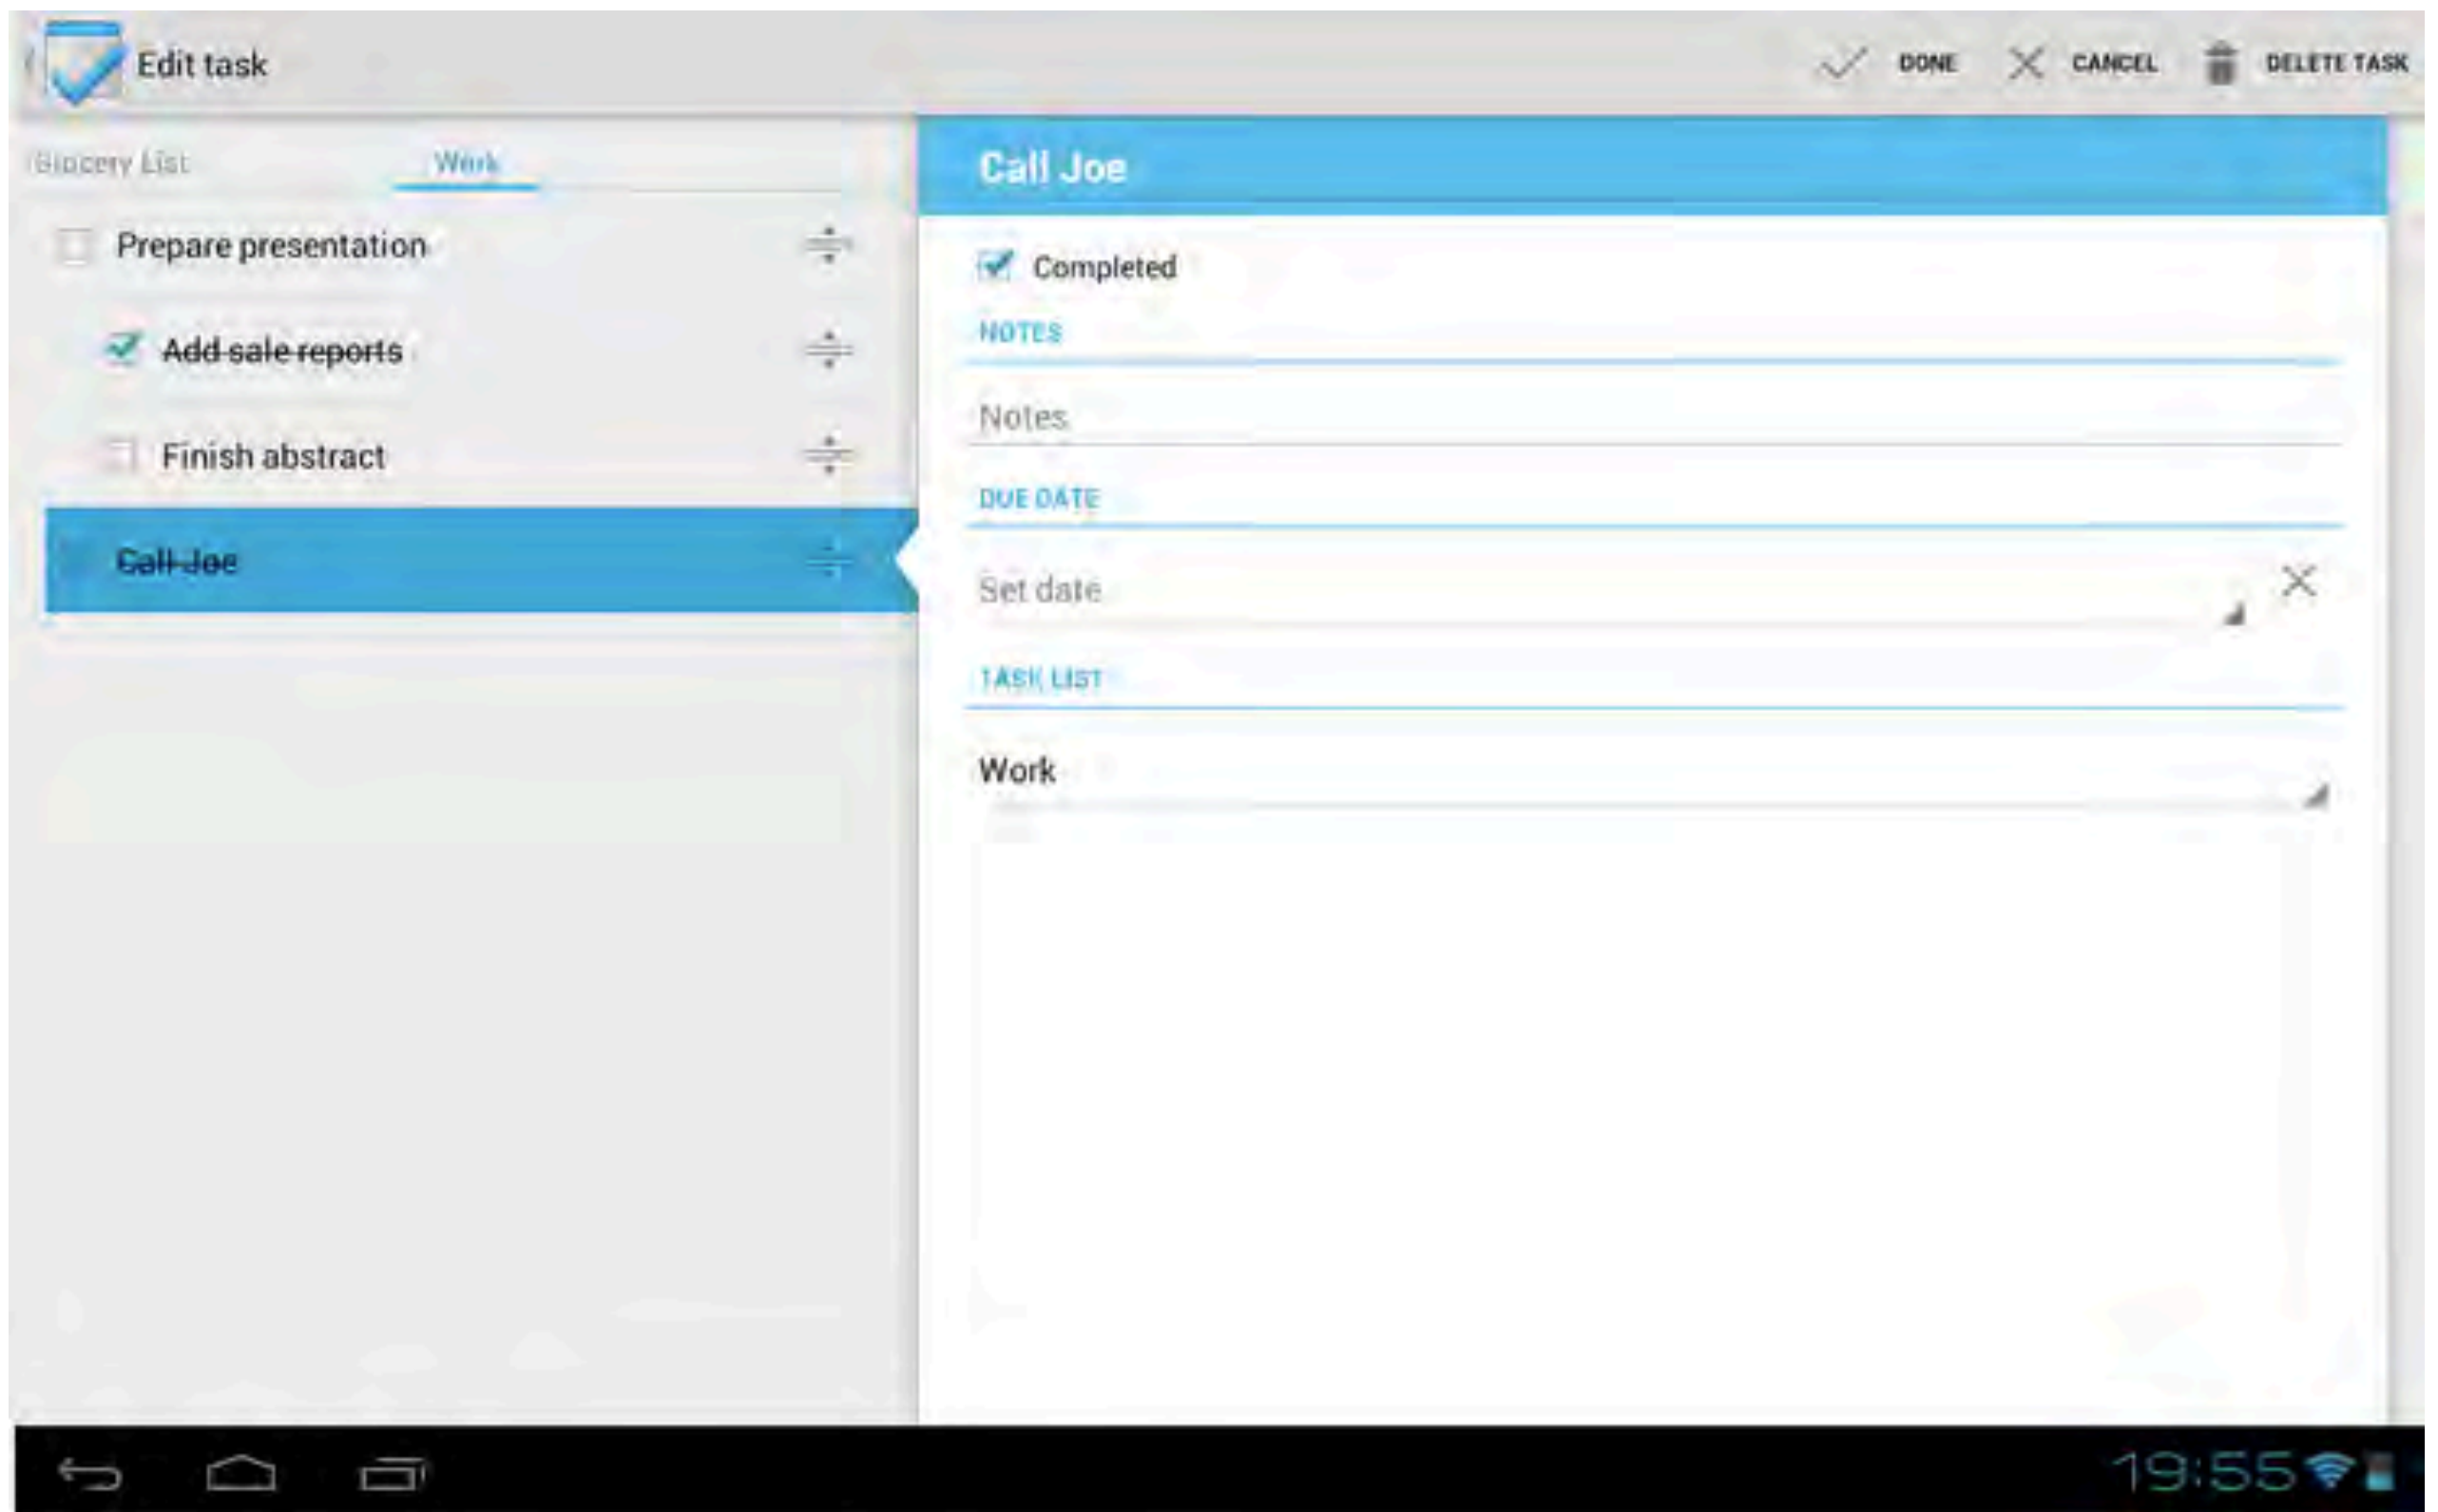

- What should your app do if the user receives a phone call while using it?

F. What happens when...?

- What should your app do if the user rotates the phone?
- What if the user tries to view your app on a larger screen or other device like a table?

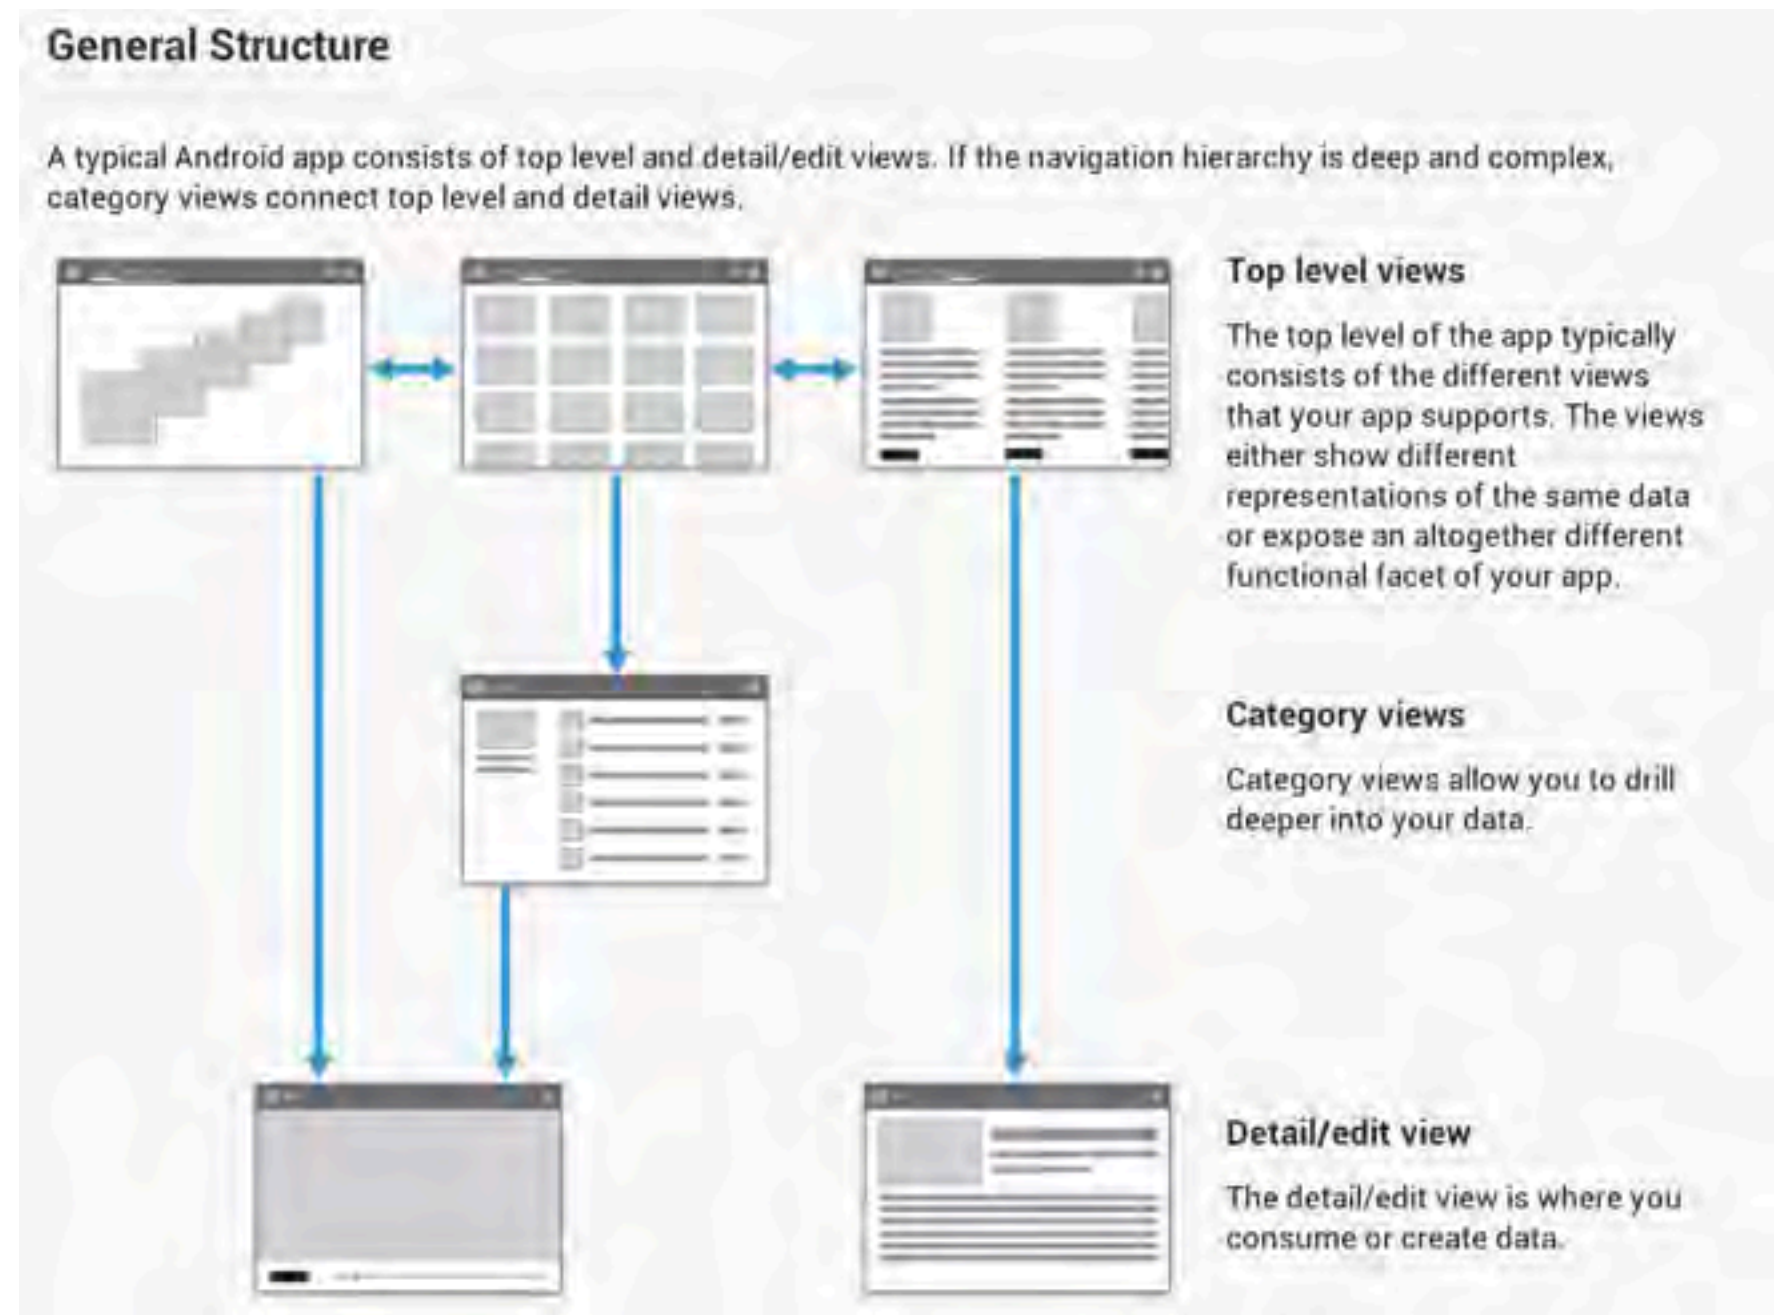

<https://play.google.com/store/apps/details?id=ch.teamtasks.tasks.paid&hl=en>

G. Define the app hierarchy

- For the major use cases, map each use case in the diagram to the application categories of data (refer to diagram at right for application categories)
- For example, the topmost category, the detailed category, etc

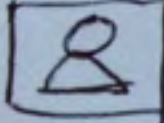

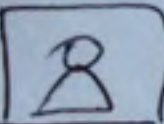

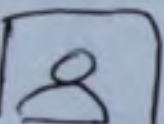

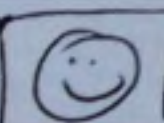

H. Define the major screens

- For the major use cases, map each use case in the diagram to an application screen and the UI components that are needed to support the use case

General Structure

A typical Android app consists of top level and detail/edit views. If the navigation hierarchy is deep and complex, category views connect top level and detail views.

Top level views

The top level of the app typically consists of the different views that your app supports. The views either show different representations of the same data or expose an altogether different functional facet of your app.

Category views

Category views allow you to drill deeper into your data.

Detail/edit view

The detail/edit view is where you consume or create data.

Questions?

- Ready for Assignment 2?

Assignment #2

- Build your ClassList application as a native mobile app using Android Studio

Build a working app

- Build the application to demonstrate the top 3-5 use cases
- Be able to demonstrate the app in class either in the emulator or on a device

Android Design

- Visit <http://developer.android.com/design/index.html>
- This is a good reference for UI design and assets

Class List App

- **Logistics**
- We will use Android Studio to build the app
 - Please install the tool Android Studio: <http://developer.android.com/sdk/installing/studio.html>
 - If you have an Android handset, make sure it is **Debugging** enabled
 - Go to Settings and make sure you have Developer Options as a choice. Set USB Debugging to ON
 - for Nexus 4 do this:
<http://irwinj.blogspot.com/2013/02/setting-up-android-debugging-on-nexus-4.html>
 - Get the sample data (Names, Photos) and use this in your app in the ZIP file **Assignment2_People.zip**

Android Development

- Visit <http://developer.android.com/develop/index.html>
- This is a good reference for developing

Metrics and Grids

Devices vary not only in physical size, but also in screen density (DPI). To simplify the way you design for multiple screens, think of each device as falling into a particular size bucket and density bucket:

The size buckets are *handset* (smaller than 600dp) and *tablet* (larger than or equal 600dp).

The density buckets are LDPI, MDPI, HDPI, XHDPI, and XXHDPI.

Optimize your application's UI by designing alternative layouts for some of the different size buckets, and provide alternative bitmap images for different density buckets.

Because it's important that you design and implement your layouts for multiple densities, the guidelines below and through the documentation refer to layout dimensions with dp measurements instead of pixels.

PHONE

320DP

360DP

TABLET

962DP

1280DP

600DP

800DP

Space considerations

Devices vary in the amount of density-independent pixels (dp) they can display.

To see more, visit the [Screen Sizes and Densities Device Dashboard](#).

53

Thumbnails and images

- Android has multiple screen sizes so visual assets are delivered in several resolutions
- In the sample data we will use XHDPI

Density-independent pixel (dp)

- A virtual pixel unit that you should use when defining UI layout, to express layout dimensions or position in a density-independent way.
- The density-independent pixel = one physical pixel on a 160 dpi screen. This is the baseline density assumed by the system for a "medium" density screen.

Density-independent pixel (dp)

- At runtime, the system transparently scales the dp units based on the actual density of the screen in use.
- The conversion of dp units to screen pixels is:
 - $px = dp * (dpi / 160)$.
 - For example, on a 240 dpi screen, 1 dp = 1.5 physical pixels.
 - You should try aim to dp units when defining your application's UI, to ensure proper display of your UI on screens with different densities.

Design for varying display sizes

- The size buckets are *handset* (smaller than 600dp) and *tablet* (larger than or equal 600dp).
- The density buckets are LDPI, MDPI, HDPI, XHDPI, and XXHDPI.

Optimize your application's UI by designing alternative layouts for some of the different size buckets, and provide alternative bitmap images for different density buckets.

- LDPI - low density (120 dpi)
- MDPI - medium density (160 dpi)
- HDPI - medium density (240 dpi)
- XHDPI - medium density (320 dpi)
- XXHDPI - medium density (480 dpi)

Different DPs for different display categories

Different DPLs for different display categories

640px x 400px

96px x 96px

400px

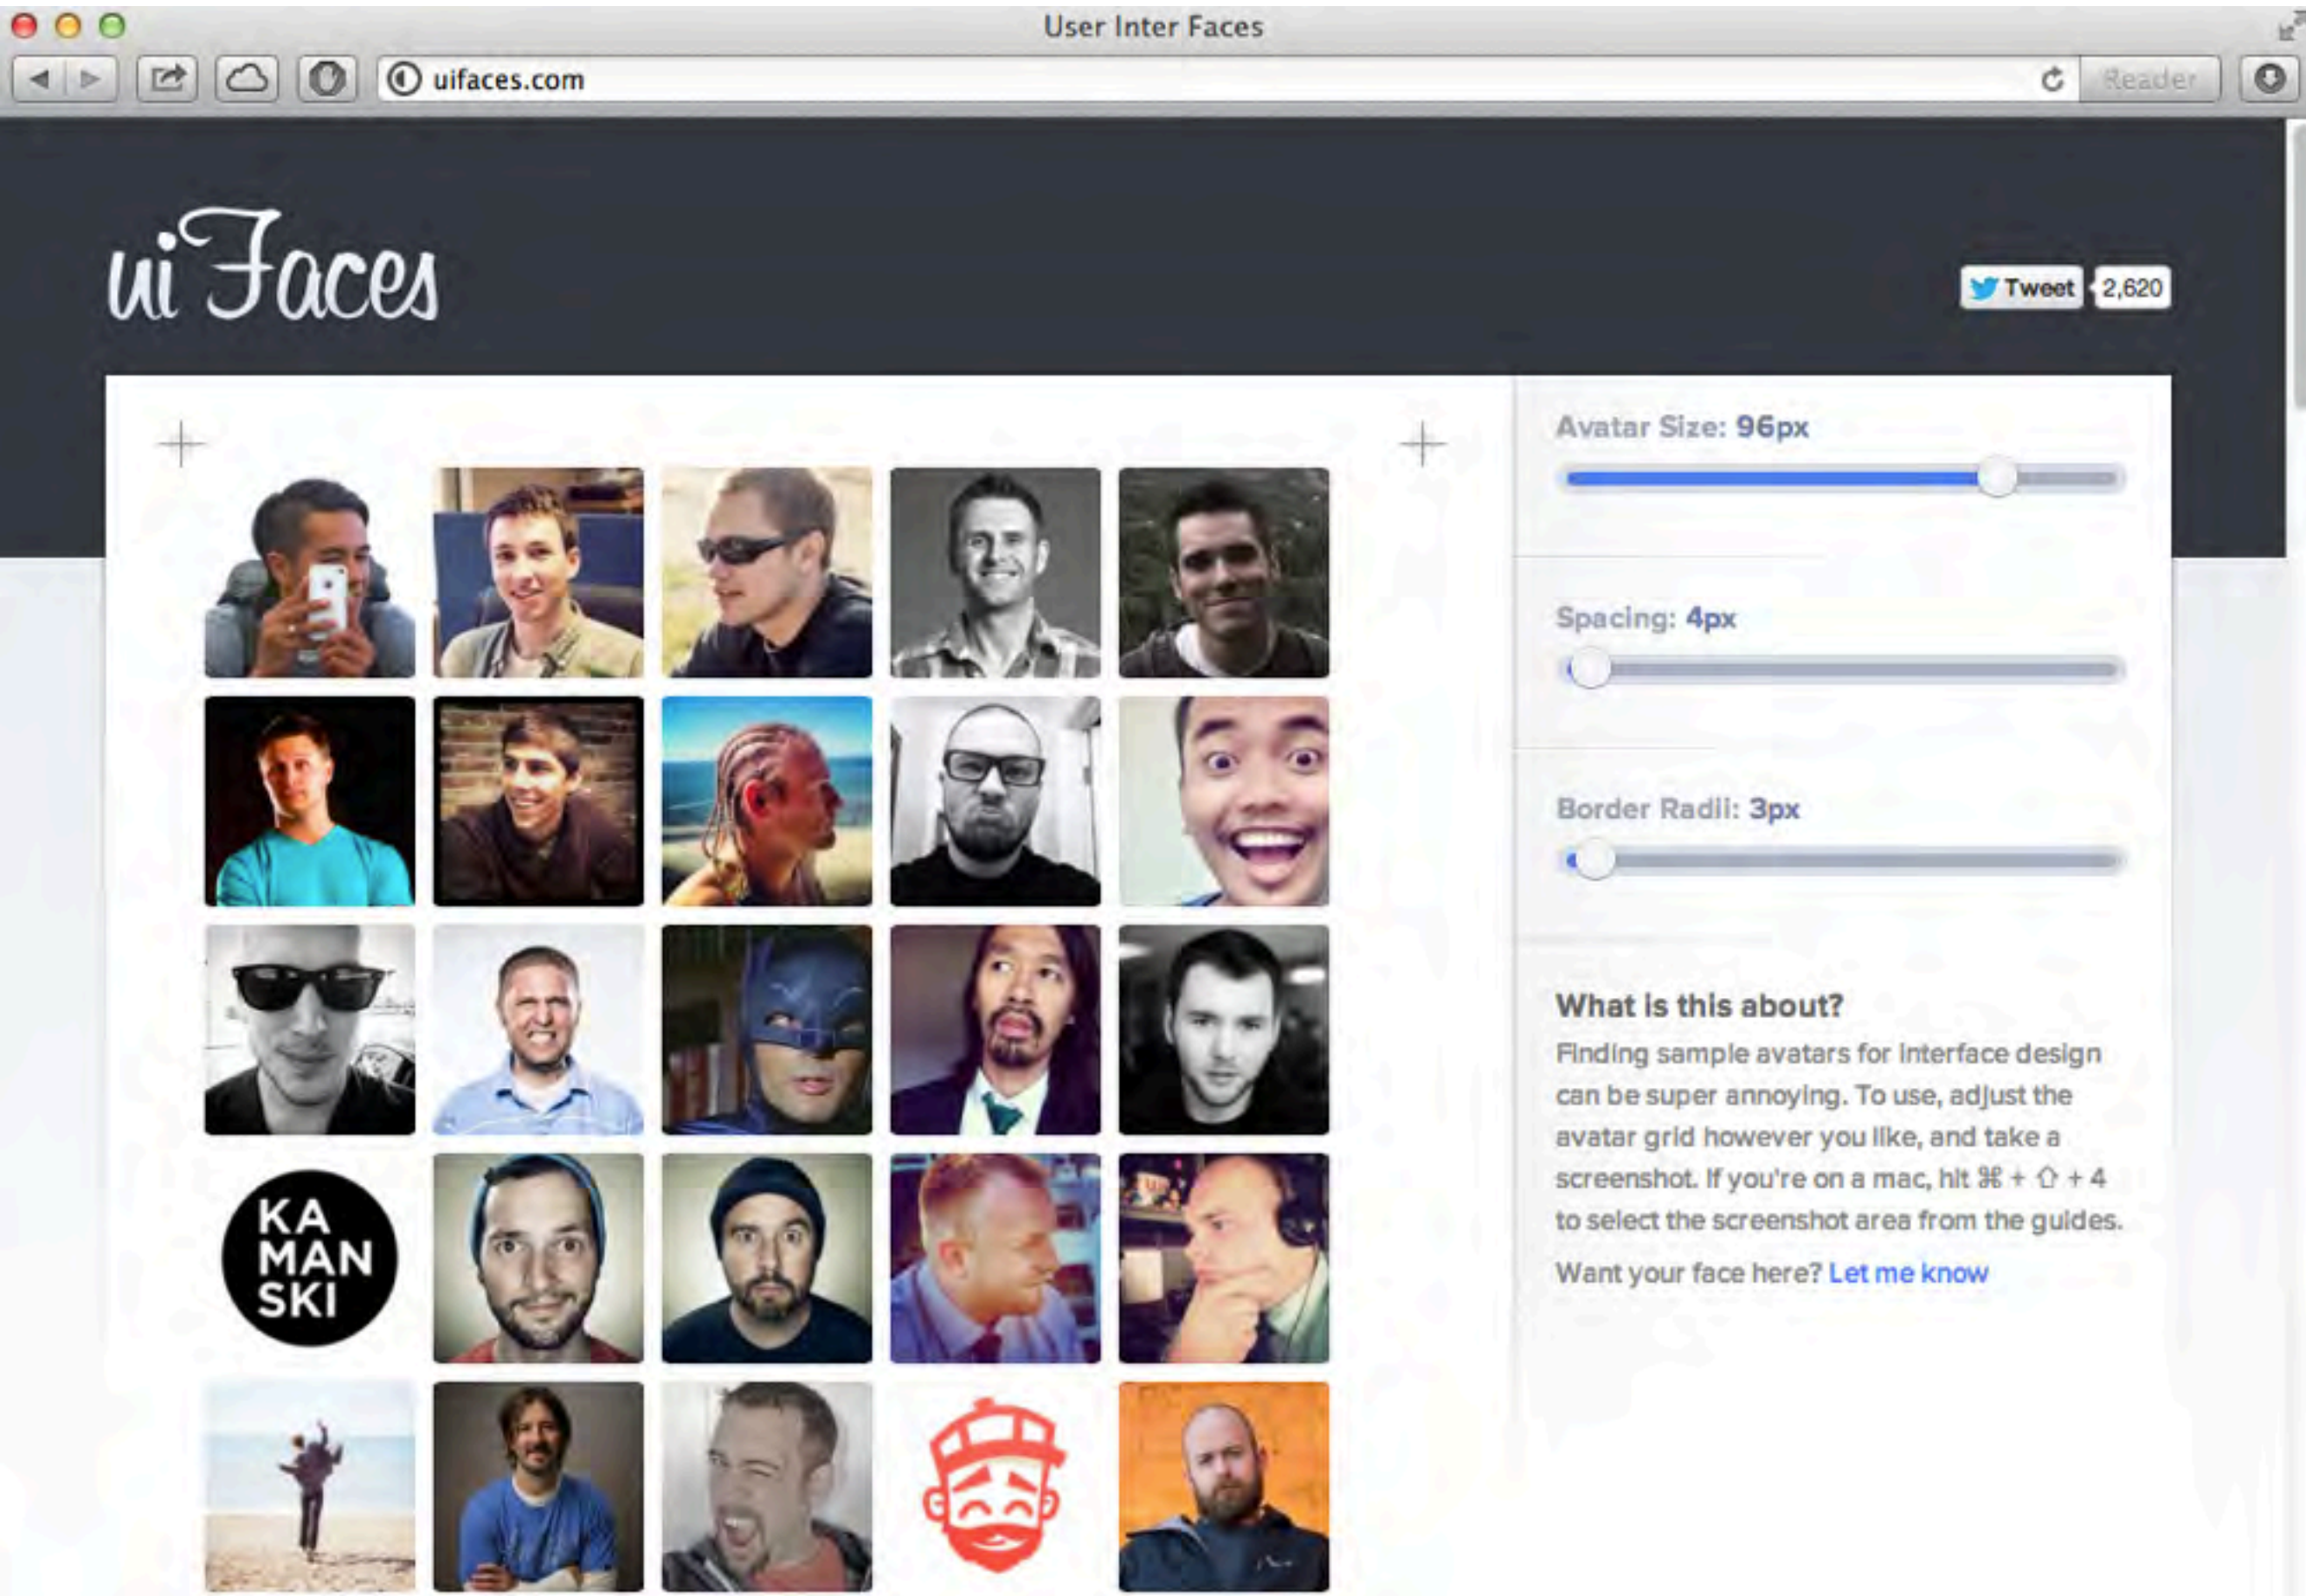

640px

Android vs iOS

- Android supports many DPIs and iOS supports two (Normal and Retina)
- Remember that both Android and iOS will scale available image assets if you are missing the correct DPI resources but they might appear blurry
- Question: What does XDPI represent in Android display densities?

Add your own images

- Feel free to add your own people photos
- This app is a “mockup” (class project for non-commercial use) so you can also use a service like <http://uifaces.com>
- This allows you to create a grid of faces to use for your app if you prefer
- NOTE: You will need an image editor to slice and resize the photos

Android

- Our class will use: Studio - <http://developer.android.com/sdk/installing/studio.html>
- To see other dev tools you can check out the SDK + ADT plug in:
 - <http://developer.android.com/tools/index.html>

Activity and UI

- <http://www.i-programmer.info/programming/android/5914-android-adventures-activity-and-ui.html>
- Activity is the code that works with a UI screen defined by the View
- The Activity is the Java code that does something and the View provides the user interface (UI)

Android app consists of

- Activity
 - the Java code that does something
 - an Activity is the code that works with a UI screen defined by the View
- View
 - provides the UI

Intent

Interacting with Other Apps

An Android app typically has several `activities`. Each activity displays a user interface that allows the user to perform a specific task (such as view a map or take a photo). To take the user from one activity to another, your app must use an `Intent` to define your app's "intent" to do something. When you pass an `Intent` to the system with a method such as `startActivity()`, the system uses the `Intent` to identify and start the appropriate app component. Using intents even allows your app to start an activity that is contained in a separate app.

An `Intent` can be *explicit* in order to start a specific component (a specific `Activity` instance) or *implicit* in order to start any component that can handle the intended action (such as "capture a photo").

Android Tutorials/Resources

- Android Adventures - Getting Started With Android Studio
- <http://www.i-programmer.info/programming/android/5887-android-adventures-getting-started-with-android-studio.html>
- For Assignment 2 please **read, view and learn** these sections
 - Getting Started With Android Studio
 - The Activity And The UI
 - Building The UI and a Calculator App
 - Lifecycle and State
 - Basic Controls And Events

Also please read/view

- Videos and tutorials in the Class Syllabus under Android and Android Studio

Android Studio demo

Android Studio

Android Studio makes creating Android apps a lot easier (limitations: **OnClick event**)

- An app has at least one Activity and this defines a screen layout and a behavior.
- The screen layout is controlled by XML markup file, Main_Activity.xml (usually) stored in the res directory.
- Drag-and-drop designer allows UI creation without having to work directly with XML.
- App behavior controlled by a Java file, MainActivity.java (usually) stored in the java directory. You can edit the code in the Java file directly in Android Studio.
- Run apps on emulator based AVD or Android device connected to laptop
- You need to create at least one AVD and start it running before trying to test your app

Sample media/assets

- Get the ZIP file Assignment2_People.zip from Karen or Aaron

Please bring your app to class

- Be ready to demo it in class
